Meeting record

ami_ES2010b_600s-900s.flac (example)

DATE	2026-10-07
DURATION	5:00
PARTICIPANTS	Speaker 1, Speaker 2, Speaker 3
PREPARED	2026-10-07 11:09 UTC

The meeting reviewed remote-control product features, component choices, power options, and internal design.

01 Summary

- The team discussed defining the remote's functionality by the devices it controls, such as DVD players or TiVo, to broaden consumer appeal.
- Research was cited indicating consumers are willing to pay more for speech-recognition capability, positioning it as a high-class feature.
- A beeping feature was proposed to help users locate a lost remote, mirroring rival products.
- It was noted that a smart chip is required for multifunctionality, or an additional chip would be needed for extra functions.
- The smart chip was described as a programmed component that can perform a fair range of functions.
- Cost concerns about an additional chip were dismissed, with the belief bulk purchasing from a newer supplier would keep production costs within budget.
- Batteries were selected as the power source because they are readily available and standard for remotes, with the number depending on size.
- Typical remotes use two AA or four AAA batteries, sometimes three, as a reference point for the design.
- A large on/off button was recommended to accommodate an older target demographic.
- The internal schematic includes a switch between the power source and the rest of the device, and an infrared bulb for communication with various devices.
- Adding a second infrared bulb was suggested to indicate functionality without requiring users to stare at the primary bulb when the battery is low.

02 Discussion by topic

Product functionality and speech recognition

0:01–1:30 · info

- Debated that functionality should be tied to specific devices like DVD players or TiVo to serve a wide range of consumers.
- Cited consumer willingness to pay more for speech-recognition as a premium feature.
- Proposed a beeping locator feature similar to competitors.

Design components and smart chip

1:38–3:08 · info

- Stated that a smart chip is needed for multifunctionality, otherwise an additional chip would be required.
- Explained what a smart chip is—a programmed component capable of a fair range of functions.
- Asserted that extra chip costs would not exceed budget due to bulk purchasing options.

Power source and button layout 2:40–3:33 · info

- Selected batteries as the power source because they are easily available and typical for remotes.
- Provided the standard battery configurations: two AA or four AAA, sometimes three.
- Recommended a large on/off button to suit an older demographic.

Schematic and infrared bulb function 3:35–4:58 · info

- Described the internal schematic with a switch and an infrared bulb for device communication.
- Suggested adding a second infrared bulb to signal functionality without staring at the primary bulb.

03 Key decisions

No explicit decisions were identified in this recording.

04 Action items

#	TASK	OWNER	DEADLINE	SOURCE
A1	Obtain a power source.	*Unspecified*	*Unspecified*	1:58 Speaker 3
A2	Obtain an additional chip.	*Unspecified*	*Unspecified*	2:11 Speaker 3
A3	Make the remote glow in the dark.	*Unspecified*	*Unspecified*	4:50 Speaker 1

05 Key figures

FIGURE	VALUE	SOURCE
battery configuration	two double a's or four triple a's, sometimes three	2:56 Speaker 3

06 Notes

- 3 of 3 action item(s) have no stated owner (shown as unspecified).
- 3 of 3 action item(s) have no stated deadline (shown as unspecified).
- No decision was recorded in this meeting.

Every item in this record is taken from the recording; the source column gives the time and speaker. Owners and deadlines appear only where the recording states them; otherwise they are marked Unspecified. The raw transcript is kept separately and unchanged.
